Operating Principles of the Mazda BPT Engine

To appreciate the maintenance practices outlined in the manual, understanding how the BPT engine operates is vital.

Combustion Cycle

The Mazda BPT engine functions through a standard four-stroke cycle:

- Intake Stroke: The intake valve opens, and the piston moves down, drawing in air and vaporized diesel fuel injected directly into the combustion chamber.
- Compression Stroke: Both valves close as the piston moves upward, compressing the air-fuel

mixture to a high pressure.

- Power Stroke: The fuel injector sprays diesel, igniting due to high compression, forcing the piston downward and generating power.
- Exhaust Stroke: The exhaust valve opens, and the piston pushes out combustion gases.

The turbocharger utilizes exhaust gases to spin a turbine, increasing intake air pressure, thus enhancing power and efficiency.

Key Features

- Direct Injection: Precise fuel delivery improves efficiency and reduces emissions.
- Variable Geometry Turbo: Adjusts turbine vanes to optimize boost across engine speeds.
- Intercooler: Cools compressed air, increasing its density for better combustion.
- Emission Control Systems: Minimize pollutants, ensuring compliance with environmental standards.
