Common Questions and Answers about Phet Radioactive Dating Simulation

1. What is the purpose of the radioactive dating game?

The game aims to teach students how scientists determine the age of rocks and fossils by measuring isotope ratios. It demonstrates the principles of radioactive decay, half-life, and how these are applied in real-world dating techniques.

2. How do I find the answers to the simulation questions?

While the simulation encourages exploration and critical thinking, here are tips:

- Carefully observe the isotope quantities over time.
- Use the decay formula:

$$\text{Age} = (\ln(N_0/N)) / \lambda$$

where N_0 is the original isotope quantity, N is the remaining quantity, and λ is the decay constant.

- Remember that each isotope has a known half-life, which can be used to calculate λ :

$$\lambda = \ln(2) / \text{half-life}$$

The simulation typically includes isotopes such as:

- Uranium-238 (half-life ~4.5 billion years)
- Uranium-235 (half-life ~700 million years)
- Potassium-40 (half-life ~1.3 billion years)
- Carbon-14 (half-life ~5,730 years)

Each isotope is suitable for dating different types of samples and age ranges.

4. How do I interpret isotope ratios in the simulation?

- A higher proportion of parent isotope indicates a younger sample.
- A higher proportion of daughter isotope indicates an older sample.
- Use the decay formula or the built-in tools to estimate age based on the ratios.

5. Are there specific strategies to get correct answers in the game?

Yes, some effective strategies include:

- Record initial isotope quantities.
