Introduction to Enzymes

Definition and Significance

Enzymes are globular proteins that catalyze biochemical reactions, increasing reaction rates without being consumed in the process. They are indispensable for life, facilitating processes such as digestion, DNA replication, and energy production. Enzymes are highly specific, often catalyzing only one particular reaction or acting on a specific substrate.

Basic Characteristics of Enzymes

- **Efficiency:** Enzymes lower activation energy, dramatically increasing reaction speeds.
- **Regulation:** Enzyme activity can be modulated by inhibitors, activators, and environmental factors.
- **Reusability:** Enzymes are not consumed in reactions and can catalyze multiple cycles.

Enzyme Structure and Classification

Enzyme Structure

Understanding enzyme structure is fundamental to grasping how they function. Enzymes typically consist of amino acid chains folded into specific three-dimensional conformations, forming the active site where substrate binding occurs.

Levels of Enzyme Structure

- **Primary Structure:** The sequence of amino acids.
- **Secondary Structure:** Local folding patterns like α -helices and β -sheets.
- **Tertiary Structure:** The overall three-dimensional shape of the enzyme.
- **Quaternary Structure:** Assembly of multiple polypeptide chains in some enzymes.

Classification of Enzymes

The International Union of Biochemistry (IUB) classifies enzymes into six major classes:

- **K_m**: The Michaelis constant, indicating substrate affinity.
- **k_{cat}**: Turnover number, the number of substrate molecules converted per enzyme per second.

Michaelis-Menten Kinetics

The Michaelis-Menten equation describes the relationship between reaction rate (V) and substrate concentration ([S]):

$$V = (V_{\max} \times [S]) / (K_m + [S])$$

This model assumes rapid equilibrium and steady-state conditions.

Lineweaver-Burk Plot

A double reciprocal plot (1/V vs. 1/[S]) helps determine kinetic parameters graphically.

Enzyme Regulation and Inhibition

Regulatory Mechanisms

Enzyme activity is finely tuned through various mechanisms:

- **Allosteric Regulation**: Binding of effectors at sites other than the active site causes conformational changes.
- **Covalent Modification**: Phosphorylation, acetylation, or methylation alter enzyme activity.
