- Identify common question types and topics
- Develop problem-solving skills and mathematical reasoning
- Build confidence in tackling challenging problems

A well-explained solved question not only clarifies concepts but also demonstrates how to approach similar problems efficiently during the actual exam. Now, let's delve into a typical problem encountered in Diploma Mathematics 1 and its detailed solution.

Sample Question: Calculus and Differential Equations

Question

A particle moves along a straight line such that its velocity $v(t)$ at time t seconds is given by:

$$v(t) = 3t^2 - 4t + 2$$

$$v(t) = 3t^2 - 4t + 2$$

$$v(t) = 3t^2 - 4t + 2$$

where $v(t)$ is in meters per second. Find:

- The displacement of the particle from $t = 0$ to $t = 4$ seconds.
- The total distance traveled by the particle in this interval.

Step-by-Step Solution with Explanation

Part (a): Calculating Displacement

Displacement over an interval can be found by integrating the velocity function:

$$\text{Displacement} = \int_a^b v(t) \, dt$$

For t from 0 to 4 seconds:

$$\text{Displacement} = \int_0^4 (3t^2 - 4t + 2) \, dt$$

Step 1: Find the indefinite integral

$$\int (3t^2 - 4t + 2) \, dt = t^3 - 2t^2 + 2t + C$$

Step 2: Evaluate the definite integral

$$\left[t^3 - 2t^2 + 2t \right]_0^4$$

Plug in $(t = 4)$:

$$4^3 - 2 \times 4^2 + 2 \times 4 = 64 - 2 \times 16 + 8 = 64 - 32 + 8 = 40$$

Plug in $(t = 0)$:

$$0 - 0 + 0 = 0$$

Result:

$$\text{Displacement} = 40 \text{ meters}$$

Part (b): Calculating Total Distance Traveled

Total distance considers the direction changes; it is the integral of the absolute value of the velocity over the interval. Because velocity may change sign, we need to identify when $(v(t) = 0)$ within the interval, to split the integral accordingly.

Step 1: Find when $(v(t) = 0)$

$$3t^2 - 4t + 2 = 0$$

Solve the quadratic:

$$t = \frac{4 \pm \sqrt{(-4)^2 - 4 \times 3 \times 2}}{2 \times 3} = \frac{4 \pm \sqrt{16 - 24}}{6}$$

]

[

$$t = \frac{4 \pm \sqrt{-8}}{6}$$

]

Since the discriminant is negative, the quadratic has no real roots, meaning $v(t)$ does not change sign in the interval $[0, 4]$.

Step 2: Determine the sign of $v(t)$ in $[0, 4]$

Pick a test point, say $t = 1$:

[

$$v(1) = 3(1)^2 - 4(1) + 2 = 3 - 4 + 2 = 1 > 0$$

]

Since the velocity is positive at $t = 1$, and the quadratic has no real roots, the velocity remains positive throughout $[0, 4]$.

Step 3: Compute total distance

Because the velocity is positive over the entire interval:

[

$$\text{Total Distance} = \int_0^4 v(t) \, dt = 40 \text{ meters}$$

]

Note: If $v(t)$ had changed sign, we would need to split the integral at the roots and take absolute values accordingly.

Summary of the Solution

| Part | Calculation | Result |

|-----|-----|-----|

| (a) Displacement | $\int_0^4 (3t^2 - 4t + 2) dt$ | 40 meters |

| (b) Total Distance | Since $v(t) > 0$ in $[0, 4]$ | 40 meters |

Additional Tips for Students

- **Practice Integration Techniques:** Master basic integrals as they form the foundation for solving such problems.
- **Check Sign Changes:** Always verify whether the velocity function changes sign within the interval to determine whether you need to consider absolute values.
- **Understand the Concept of Displacement vs. Distance:** Displacement is the net change in position, while total distance accounts for actual path traveled, regardless of direction.
- **Use Graphical Methods:** Sketching the velocity graph can help visualize sign changes and the particle's motion.
- **Review Quadratic Roots:** Solving quadratic equations accurately is crucial for identifying points where velocity changes sign.

Conclusion

Practicing solved questions like this not only enhances understanding of calculus principles but also prepares students for similar problems in diploma examinations. Remember to carefully analyze the problem, apply the correct mathematical techniques, and verify each step for accuracy. With consistent practice and a clear understanding of concepts, success in diploma mathematics is well within reach.

- Boost Confidence: Seeing step-by-step solutions reduces anxiety and builds confidence to attempt similar questions independently.
- Exam Preparation: Practice with solved questions familiarizes students with exam patterns and question framing.

Typical Topics Covered in Diploma Mathematics 1

Diploma Mathematics 1 usually encompasses fundamental topics such as:

- Algebra
- Trigonometry
- Coordinate Geometry
- Calculus (Basics)
- Sequences and Series

For the purpose of this article, we will focus on a classic problem from the coordinate geometry section, which often appears in exams.

Sample Question: Solved Problem from Coordinate Geometry

Question:

Find the equation of the line passing through the points $(A(2, 3))$ and $(4, 7)$, and determine whether the line is parallel or perpendicular to the line passing through points $(B(1, 2))$ and $(3, 5)$.

Step-by-Step Solution and Explanation

Step 1: Find the slope of the first line passing through points $(A(2, 3))$ and $(C(4, 7))$

The slope (m_1) of a line passing through two points $((x_1, y_1))$ and $((x_2, y_2))$ is given by:

[

$$m_1 = \frac{y_2 - y_1}{x_2 - x_1}$$

]

Substituting the values:

[

$$m_1 = \frac{7 - 3}{4 - 2} = \frac{4}{2} = 2$$

]

This indicates that the slope of the first line is 2.

Step 2: Find the slope of the second line passing through points $(B(1, 2))$ and $(D(3, 5))$

Similarly, the slope (m_2) :

[

$$m_2 = \frac{5 - 2}{3 - 1} = \frac{3}{2}$$

]

So, the slope of the second line is $(\frac{3}{2})$.

Step 3: Determine the relationship between the two lines

- Parallel lines have equal slopes: $(m_1 = m_2)$
- Perpendicular lines have slopes that are negative reciprocals: $(m_1 \times m_2 = -1)$

Calculating the product:

$\backslash$

$$m_1 \times m_2 = 2 \times \frac{3}{2} = 3$$

$\backslash$

Since the product is 3, which is neither 1 nor -1, the lines are neither parallel nor perpendicular.

Step 4: Find the equation of the first line passing through point $(A(2, 3))$ with slope (2)

Using the point-slope form:

$\backslash$

$$y - y_1 = m (x - x_1)$$

$\backslash$

Substituting:

$\backslash$

$$y - 3 = 2 (x - 2)$$

$\backslash$

Simplify:

$\backslash$

$$y - 3 = 2x - 4$$

$\backslash$

$\backslash$

$$y = 2x - 4 + 3$$

\]

\[

$$\boxed{y = 2x - 1}$$

\]

This is the equation of the line passing through points (A) and (C) .

Summarizing the Key Results

- The slope of the first line: 2
- The slope of the second line: $\frac{3}{2}$
- The lines are neither parallel nor perpendicular
- Equation of the first line: $y = 2x - 1$

Additional Insights and Tips for Students

Understanding Slopes and Line Equations

- The slope-intercept form of a line: $y = mx + c$, where (m) is the slope and (c) is the y-intercept.
