Step-by-Step Examples of Measure of Angle Word Problems

Example 1: Finding an Unknown Angle in a Triangle

Problem: In triangle ABC, angle A measures 50° , and angle B measures 60° . What is the measure of angle C?

Solution:

- Recall the Triangle Sum Theorem: The sum of interior angles in a triangle is 180° .
- Set up the equation:

$\{$

$$\text{Angle A} + \text{Angle B} + \text{Angle C} = 180^\circ$$

\]

- Substitute known values:

\[

$$50^\circ + 60^\circ + \text{\text{Angle C}} = 180^\circ$$

\]

- Solve for angle C:

\[

$$\text{\text{Angle C}} = 180^\circ - 50^\circ - 60^\circ = 70^\circ$$

\]

Answer: The measure of angle C is 70° .

Example 2: Using Parallel Lines and Transversals

Problem: Two parallel lines are cut by a transversal. If the alternate interior angle measures 65° , what is the measure of the corresponding angle?

Solution:

- Recall properties:
 - Alternate interior angles are equal when lines are parallel.
 - Corresponding angles are equal when lines are parallel.
- Identify the angles:

Since the angles are alternate interior, they are equal:

\[

$$\text{Corresponding angle} = 65^\circ$$

\]

Answer: The measure of the corresponding angle is 65° .

Example 3: Finding Angles in a Quadrilateral

Problem: In a quadrilateral, three angles measure 90° , 85° , and 100° . What is the measure of the fourth angle?

Solution:

- Recall the Quadrilateral Sum Theorem: The sum of interior angles in a quadrilateral is 360° .
- Set up the equation:

\[

$$90^\circ + 85^\circ + 100^\circ + \text{Unknown angle} = 360^\circ$$

\]

- Calculate the unknown angle:

\[

$$\text{Unknown angle} = 360^\circ - (90^\circ + 85^\circ + 100^\circ) = 360^\circ - 275^\circ = 85^\circ$$

\]

Answer: The measure of the fourth angle is 85° .

With practice and patience, solving measure of angle word problems can become an engaging and rewarding experience, unlocking the secrets of geometric relationships woven into everyday life.

Question/Answer How do you determine the measure of an angle when given two intersecting lines and one known angle? When two lines intersect, the opposite (vertical) angles are equal. If one angle is known, the measure of the vertical angle can be directly assigned to it. Alternatively, if the angles form a linear pair, their measures add up to 180° , so you can subtract the known angle from 180° to find the unknown. What is the method to find the missing angle in a triangle given two angles? In a triangle, the sum of the interior angles is always 180° . If two angles are known, subtract their sum from 180° to find the measure of the third angle. How can you find the measure of an angle in a parallelogram if only some angles are given? In a parallelogram, opposite angles are equal, and adjacent angles are supplementary (sum to 180°). Use these properties to set up equations based on the known angles and solve for the unknowns. When given an angle and a supplementary or complementary relationship, how do you find the other angle? For supplementary angles, subtract the known angle from 180° . For complementary angles, subtract the known angle from 90° . These calculations give the measure of the unknown angle. How do you approach a word problem involving angles where multiple angles are related through algebraic expressions? Identify the relationships between the angles (e.g., equal, supplementary, complementary), write algebraic expressions for each, and then set up equations based on these relationships. Solve the equations to find the values of the unknown angles.

Solution:

$$V_{out} = V_{in} R_2 / (R_1 + R_2) = 12V \cdot 2000\Omega / (1000\Omega + 2000\Omega) = 12V \cdot 2000 / 3000 = 8V$$

Problem 3: AC Circuit Analysis

Find the impedance of an inductor $L=0.5H$ and capacitor $C=100\mu F$ at 60Hz.

Solution:

$$X_L = 2\pi fL = 2\pi \cdot 60 \cdot 0.5 = 188.5\Omega$$

$$X_C = 1 / (2\pi fC) = 1 / (2\pi \cdot 60 \cdot 100e-6) = 26.5\Omega$$

$$\text{Impedance } Z = \sqrt{X_L^2 + X_C^2} = \sqrt{(188.5^2 + 26.5^2)} = 190.3\Omega$$
